Executive Summary

Background

Senior Project Manager Alyssa Gleason has made it evident that she has suspicions that Schultz and Dooley Inc. employees are using the Internet for personal reasons during scheduled work hours. Alyssa Gleason had previously extracted a captured Random Access Memory (RAM) image from a suspected offenders' workstation.

Request

On 8/1/2018 Senior Project Manager Alyssa Gleason requested that the Senior Forensic Examiner at Schultz and Dooley Inc. examine the memory image file previously extracted by Senior Project Manager Alyssa Gleason. Alyssa Gleason specifically requests that the Examiner locate and record any instances of browser activity. The Examiner was requested to analyze the data in order to enumerate evidence relating to the misuse of company resources.

Summary of Findings

The Examiner was able to determine various important pieces of information from analyzing the memory.img file using the Volatility Framework. By implementing Volatility, the Examiner determined the possible profiles were: **Win2008R2SP0x64**, **Win7SP1x64**, **Win7SP0x64**, and **Win2008R2SP1x64**. The Examiner was able to determine that the Operating System was either **Windows 7 x64** or **Windows 2008 R2 x64**. Both possible Operating Systems were running 64-bit architectures, so the Examiner determined the memory image was taken from a computer running on a 64-bit architecture processor. It was evident to the Examiner that there were instances of Google Chrome and Internet Explorer active at the time of memory acquisition. The Examiner also determined that the Process ID of Google Update was: **3300**, and the application running on Process ID 3780 was: **Adobe Acrobat Reader**. The Examiner was able to locate the history of commands, and the DLL list. The Examiner was able to successfully determine that AVG antivirus ran from: **C:\Program Files (x86)\AVG\Av\avgcsrva.exe**. The Examiner was able to successfully locate three instances of Google Chrome running with an established connection during the memory image capture. The three outbound Google Chrome connections were: **74.125.228.206:443**, **74.125.228.216:80**, and **184.168.27.206:80**.

Evidence

Table 1 outlines the evidence items of this case.

Description	Designation	Filename	MD5 Hash

Table 1: Case evidence items

Collection and Analysis

Collection

On 8/5/2018, the Examiner utilized Wget v1.17.1 to download the file memory.zip from the URL <https://s3-us-west-2.amazonaws.com/digitalforensicsworkbook/memory.zip>. The Examiner can be seen downloading memory.img in *Figure 1* below. Once downloaded the Examiner began to conduct proper digital evidence preservation techniques. The Examiner utilized the Cp command to create WC_memory.zip and PRES_memory.zip. Once all three zip files were located in ~/Desktop/MemoryLab/, The Examiner ran Hashdeep v4.4 to retrieve each .zip files MD5 hash value. The MD5 hash values and the Examiner's implementation of Hashdeep can be seen in *Figure 2* below. The Examiner successfully obtained the MD5 hash values with Hashdeep v4.4, then compared them to the MD5 hash value provided on the webpage hosting the .zip file which can be seen in *Figure 3*.

```
linux@CYB356-04:~$ sudo wget https://s3-us-west-2.amazonaws.com/digitalforensicsworkbook/memory.zip

```
memory.img | MD5: 6515148944d1096cdff0fd678d85664c | SHA1: oda63a5e6456b65f889a0e6a0ca29737d6da1a0b
```

Figure 3: Hash Values Provided on Webpage Hosting the .zip File

At this point the Examiner had successfully downloaded the .zip file using Wget v1.17.1, and successfully created preservation and working copies. The Examiner then continued to unzip the file WC_memory.zip which produced memory.img. This Examiner can infer that all the .zip files contained identical memory.img files since their MD5 hash values were identical. The Examiner can be seen utilizing the unzip command and hashing the file memory.img in *Figure 4*.

```

linux@CYB356-04:~/Desktop/MemoryLab$ sudo unzip WC_memory.zip
Archive:  WC_memory.zip
  inflating: memory.img
linux@CYB356-04:~/Desktop/MemoryLab$ ls

```

Figure 4: Image File Extraction and Hashdeep v4.4 MD5

Analysis

The Examiner began the analysis of memory.img extracted from WC_memory.zip by running the Volatility command: `$ vol.py imageinfo -f memory.img`. This command returned the Examiner with not only the possible Operating Systems, but also the system architecture. The possible Operating Systems can be determined by which of the suggested profiles are available. It can be seen in Figure 5 that the possible Operating Systems are Windows 7 and Windows 2008R2, and the processor is a 64-bit AMD. The Examiner was unable to indefinitely determine the correct profile through trial and error. For the rest of the analysis the Examiner implemented the `-profile=Win7SP1x64` in his Volatility syntax.

```

linux@CYB356-04:~/Desktop/MemoryLab$ vol.py imageinfo -f ~/Desktop/MemoryLab/memory.img

```

Figure 5: Imageinfo Extracted With Volatility

The Examiner's next step was to locate any evidence of active web browsers. The Examiner completed this function by implementing the command: `$ vol.py pslist -f ~/Desktop/MemoryLab/memory.img`. When the Examiner executed this syntax, the Examiner was presented with findings that both Google Chrome and Internet Explorer were active in this memory image file. The Examiner's findings can be seen in Figure 6 below.

```

0xfffffa8006939b10 chrome.exe 3564 2056 31 765 1 1 2015-10-12 11:34:25 UTC+0000

linux@CYB356-04:~/Desktop/MemoryLab$ grep cat.txt

```

Figure 6: Web Browsers Located With Pslist.

The Examiner continued on to output the results of : **\$ vol.py pslist -f ~/Desktop/MemoryLab/memory.img** to a text file named Test.txt. Once Test.txt was created the Examiner then used GREP to locate the Process ID for Google Update, and to locate which process was running on PID 3780. The Examiner can be seen enumerating the desired information by utilizing GREP in *Figure 7*. The Process ID for GoogleUpdate.exe was: **3300**. The software application running on Process ID 3780 was AcroRd32.exe, which was Adobe Acrobat Reader.

```
Linux@CYB356-04:~/Desktop/MemoryLab$ grep -i "GoogleUpdate" Test.txt
0xfffffa80055d3060 GoogleUpdate.e 3300 2452 5 134 0 1 2015-10-12 03:57:18 UTC+0000
Linux@CYB356-04:~/Desktop/MemoryLab$ grep -i "3780" Test.txt
0xfffffa80042a1b10 AcroRd32.exe 3780 4368 7 318 1 1 2015-10-12 11:05:26 UTC+0000
Linux@CYB356-04:~/Desktop/MemoryLab$
```

Figure 7: GREP Commands Locating Google Update and PID 3780

The Examiner was tasked with locating the software tool used by Senior Project Manager Alys sa Gleason to extract the memory image file. The Examiner determined that due to the nature of memory acquisitions it was inevitably the last program run. The last program run on the memory image was FTK Imager.exe which was run at 2015-10-12 11:41:01 UTC+0000. The Examiner's results can be located in *Figure 8* below.

```
0xfffffa8006fb5270 FTK Imager.exe 3460 2056 14 375 1 1 2015-10-12 11:41:01 UTC+0000
```

Figure 8: Memory Extraction Software

The Examiner proceeded to extract the command history from memory.img by implementing the cmdscan tool located in the Volatility Framework. The syntax used by the Examiner was: **\$vol.py cmdscan -f ~/Desktop/MemoryLab/memory.img --profile=Win7SP1x64**. The Results of the cmdscan tool can be seen located in *Figure 9*.

```
Linux@CYB356-04:~/Desktop/MemoryLab$ vol.py cmdscan -f ~/Desktop/MemoryLab/memory.img --profile=Win7SP1x64

Figure 9: History of Commands Executed in memory.img

Next the Examiner extracted the DLL files from the memory image using the syntax: `$vol.py dlllist -f ~/Desktop/MemoryLab/memory.img -profile=Win7SP1x64 | sudo tee dlllist.txt`. By outputting this file to a text file, the Examiner was able to perform GREP searches locating the desired information. The Examiner can be seen completing this function in *Figure 10* below. In this analysis the Examiner was attempting to locate the absolute path of AVG which was enumerated by implementing GREP as: `$ grep -i "AVG" dlllist.txt`. The Examiner's implementation of GREP can be seen in *Figure 11* below. The absolute location of AVG antivirus was shown to be: `C:\Program Files (x86)\AVG\Av\avgcsrva.exe` which can be seen in *Figure 11*.

Figure 11: dlllist.txt Instances of AVG

The Examiner's final search was attempting to locate the external IP addresses connected to Google Chrome at the time of the memory acquisition. The Examiner began by first outputting the results from the Netscan tool within the Volatility Framework. The output of Netscan can be seen in *Figure 12* below. Next, the Examiner output the results of this Netscan command into a text file named NetTest.txt. After NetTest.txt was populated with the necessary data the Examiner used the GREP tool to extract all instances of the word "chrome" in NetTest.txt.

```

Figure 13: External IP Addresses Connected to Chrome at Time of Capture.

In Figure 13 above it is evident that there were multiple connections to Google Chrome at the time of memory acquisition. Only three of the connections were ‘ESTABLISHED’ connections marking that they were actively running at the time of memory acquisition. The Examiner enumerated the active Google Chrome Connections at the time of memory acquisition to be **74.125.228.206:443**, **74.125.228.216:80**, and **184.168.27.206:80**.

Conclusion

Senior Project Manager at Schultz and Dooley Inc. Alyssa Gleason, requests that the Senior Forensic Examiner analyses the previously collected memory image in order to determine if the employee was using a web browser during work hours.

The Senior Forensic Examiner at Schultz and Dooley Inc. has successfully determined that there were three instances of Google Chrome running with an established connection during the time the memory image was captured. The Senior Forensic Examiner is confident that there is enough inculpatory evidence to undoubtably say that the suspect was using a web browser during work hours.

Appendix

Appendix A: Examiner Workstation Specifications

- Computer Name: BrianCarrWorkstation
- Operating System (OS) Name: Windows 10
- OS Version: Student Edition
- System Make/Model: MSi GS63VR Stealth Pro
- System Serial Number: K1612N0043395
- Time Zone of Examiner Machine: Eastern Daylight Time (-4:00 GMT)
- System date/time is consistent with the time zone listed above, as verified by <http://nist.time.gov/>.

Appendix B: Tools

- Hashdeep v4.4
- Wget v1.17.1
- Volatility Framework v2.6
- Grep (GNU grep) 2.25
